

Weight mixture Drum

Easy to operate and install.

Reliability

The **FeedTronic batch weigher drum** operates alongside the Agrologic FeedTronic and Image controllers. Feed is dispensed into the cone, weighed, then released into a bin below, from where it is transferred to the poultry shed.

The drum consists of three main components: the cone, load cell, and electronic door.

The **FeedTronic batch weigher drum** is designed to work in conjunction with the Agrologic FeedTronic and Image controllers, forming an efficient feeding system for poultry operations. The process begins when feed is dispensed into the cone section of the drum.

This cone acts as the initial holding chamber for the feed. Once the feed is inside the cone, a load cell located beneath it accurately measures the weight of the feed. This ensures that the correct amount of feed is prepared for delivery, helping to maintain precise control over feeding portions.

After the feed is weighed, the electronic door at the bottom of the cone opens automatically.

This action releases the feed into a bin situated directly below the drum. From this bin, the feed can be easily transferred to the poultry shed, where it is distributed to the birds. The automated system streamlines the feeding process, reduces manual

labor, and promotes consistent and efficient feed management.

The drum itself is made up of three key components: the cone, which holds and funnels the feed; the load cell, which weighs the feed with high accuracy; and the electronic door, which controls the release of feed at the proper time. Each part plays an important role in ensuring that the overall feeding process runs smoothly and reliably. By using this system, poultry farmers can achieve better results in terms of feed control, animal health, and operational efficiency.

Technical specification

Frame: 50x50x50

Drum height: 70cm
